

HEALTH CARE FOR THE HOMELESS: ESSENTIAL HOSPITALS AND COMMUNITY PARTNERSHIPS

AUTHORED BY:*Janelle Schrag, MPH***KEY FINDINGS**

- Homelessness is a social condition that is closely associated with poor health outcomes and overuse of health care services.
- Essential hospitals represent a critical stage of intervention for redirecting homeless patients to appropriate medical care, social services, and stable housing.
- Rethinking the discharge process for homeless patients could be the most effective intervention to improve these patients' health outcomes.
- Breaking down care siloes and partnering with community services can aid essential hospitals in providing homeless patients comprehensive services that reach beyond the hospital stay.
- Having a community presence and making time for in-person meetings can greatly facilitate partnerships between hospitals and other community organizations.

HOMELESSNESS AND HEALTH

Homelessness is a complex social factor that is closely connected with health and health care. Financial burdens due to medical or mental health needs are a common cause of homelessness. At the same time, insufficient housing can exacerbate medical conditions, and insufficient access to primary care perpetuates these problems. As a result, many homeless individuals rely heavily on the emergency department (ED) as their most reliable and accessible source of care. Such utilization patterns result in costly, often uncompensated, charges for hospitals and health systems.

Homeless patients are roughly 4.5 times more likely to use the ED than patients who are not homeless.¹ Once admitted, homeless patients typically have longer lengths of stay than non-homeless patients.^{2,3} This is due to the level of attention their unmet medical needs require. What's more, homeless patients are more likely to be admitted for conditions that could be treated in primary care, which reflects their health care access issues. Homeless patients are also at much greater risk for returning to the ED and being readmitted after they are discharged,^{4,5} typically for the same or a similar diagnosis as their initial visit.⁵

For medical professionals, linking

Homeless patients are roughly 4.5 times more likely to use the ED than patients who are not homeless.

homeless patients to primary care services is often thought of as the best method for treating their medical needs and reducing the burden on the health care system. Beyond the medical field, the most widely accepted form of effective treatment is linking homeless patients to housing services. Both ideas are valid and hold promising outcomes. However, these methods often remain siloed, as health care is traditionally detached from housing and other social services.

A common missing link in this discussion is the role of essential hospitals in addressing homelessness and the solutions they offer. Essential hospitals provide care for the most vulnerable in their communities and are often the first providers to touch homeless patients. Mainly, as homeless patients seek medical care through the ED, essential hospitals represent a critical stage for intervention. However, care siloes, misaligned incentives, and unrealized partnerships are perpetuating inefficiencies in this area.

As homeless patients seek medical care through the ED, essential hospitals represent a critical stage for intervention

To improve care for homeless patients, essential hospitals must be involved in larger, community-based efforts. This brief will summarize the role essential hospitals play in caring for homeless patients, strategies for improving care for the homeless, potential partners for essential hospitals, and recommendations for forming sustainable partnerships.

THE RELENTLESS CYCLE

Estimates from 2014 suggest there are approximately 578,424 homeless individuals and families across the United States on any given night.⁶ Often centralized in urban areas, many of these individuals are likely to become patients at essential hospitals. The cycle begins when a homeless person has a medical need. This person will most often seek care in the ED of a nearby hospital (see Figure 1).

This begins the traditional hospital role of caring for homeless patients. After coming into the ED, patients are admitted, most likely for a longer than average stay. Finally, when they are discharged back to the street, a hazardous environment for recovery, this cycle begins again.

AN ESSENTIAL STAGE FOR INTERVENTION

As homeless patients continue to rely on the ED, hospitals represent an essential stage for intervention. Multiple studies have shown the right programs during the hospital phase can lead to fewer readmissions,

shorter lengths of stay, and improved health outcomes.^{4,7-10}

Hospitals' reach, however, can also extend beyond the ED. At any point in the cycle, hospitals can facilitate change. Using other strategies, such as outreach, hospitals can step outside of their traditional role and modify the sequence. Most importantly, nontraditional strategies, interventions, and partnerships can not only break this cycle of overutilization and poor health outcomes, but can also break the greater cycle of homelessness.

STRATEGIES FOR IMPROVING CARE

There are a number of strategies hospitals can use to better care for homeless patients, particularly during the patient's hospital stay.

Collect Accurate Patient Data

Improving patient care begins when the patient presents at the ED.

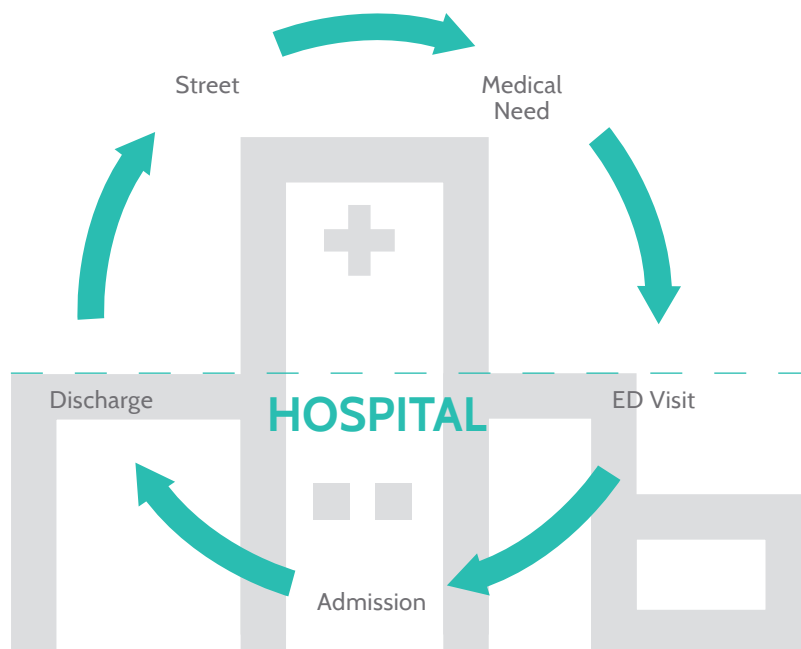

Registration staff should collect patients' housing status by asking the patient¹¹ and using the available International Classification of Diseases (ICD) 9th/10th Edition codes in the patient's medical record. Much like collecting race, ethnicity, and language data, staff cannot rely solely on patient profiling. It is an inefficient practice that often results in care that is not comprehensive.

Next, the clinicians who engage with patients should review this information on their charts and facilitate conversations with patients about their housing status, medical needs, and other social issues.

Redirect Patients to Primary Care

Identifying patients as homeless and understanding their medical needs creates an opportunity to redirect them to more appropriate services—most importantly, primary care—before an unnecessary admission. Many homeless patients do not have

FIGURE 1: TYPICAL HOMELESS PATIENT/HOSPITAL CYCLE

regular contact with primary care. Patients who present at the ED but really only need outpatient care can be connected to a local primary care site, avoiding unnecessary inpatient stays in the short and long term. However, these connections must be more significant than discharging patients with a referral. Providers should physically assist or transport homeless patients to primary care clinics and introduce them to the new staff teams who will be treating them.¹² Team members such as patient navigators, social workers, community health workers, and care coordinators may already be familiar with primary care clinics and staff and thus can play a vital role in this care transition.

Redesign the Discharge Process

The most essential strategy hospitals can use when treating homeless patients is redesigning the discharge process. Most times, the cause of readmission for homeless patients can be traced back to how and where a homeless patient was discharged. Patients who are discharged to the streets, do not receive transportation assistance, or are discharged after dark are highly likely to return to the ED.^{4,6,11,13}

It is important for discharge providers to recheck patients' housing status and discharge them to an appropriate location that is not the streets. Such locations include shelters, supportive housing sites, homes of friends or family, and respite programs. Most homeless patients do not have

Most times, the cause of readmission for homeless patients can be traced back to how and where a homeless patient was discharged.

reliable transportation. Therefore, transportation services should always be offered, especially after dark.¹³ When discharging patients to a local service, such as a shelter or supportive housing, their admission should always be confirmed in advance of and upon arrival.

Discharge to Medical Respite

When homeless patients are recovering from their inpatient stay, yet are not sick enough to stay in the hospital, they should be discharged to a medical respite program. Medical respites offer a safe place for homeless patients to recover with a full medical staff rather than returning to the streets.¹⁴ In addition, medical respites typically offer additional social services to help patients break the cycle of homelessness. Homeless patients who receive care at medical respites show a reduction in admissions and total hospital days, 90-day readmissions, and admission length of stay.¹⁵

Outreach

Hospitals can also improve care by meeting homeless patients where they are. Outreach efforts are an important practice to incorporate when caring for the homeless, as many ED visits occur when medical, behavioral, or substance abuse issues have exacerbated to critical levels. Routinely addressing patients' needs before a hospital visit can mitigate

Mini-Case Study: Santa Clara Valley Medical Center and the Valley Homeless Healthcare Program

In San Jose, California, Santa Clara Valley Medical Center (SCVMC) runs the Valley Homeless Healthcare Program (VHHP). The program's main physical site is a clinic that serves as a patient-centered medical home. VHHP also has a 20-bed medical respite program that operates out of the local homeless shelter. This collocation of services has been a key element for the success and coordination of care for homeless patients. Patients are familiar with the often-overlapping staff of all three programs, and transportation is easier, as patients can receive care from multiple services in one location. Additionally, the clinic operates on a walk-in only basis, preventing the need for patients to make appointments in advance, and runs an intensive outreach program.

VHHP is also closely engaged with SCVMC and six other local hospitals. The program operates partially on a "pay for play" funding stream, meaning the hospitals contribute funding so they can send their patients to the clinic and respite program.

This is one model of how hospitals can partner with respite programs. To date, the participating hospitals have seen more than \$5 million in savings since 2008, more than 1,000 hospital days saved, and 99 percent of patients placed into stable housing.²⁹⁻³¹

long inpatient stays and serve as another method for redirecting patients to primary care¹⁶ or other services.^{17,18} In addition, outreach helps medical staff get to know their local homeless community and build relationships with patients, which ultimately can facilitate better care coordination.

POTENTIAL PARTNERS FOR ESSENTIAL HOSPITALS

The majority of the strategies discussed require close connections or partnership with entities beyond the hospital walls. Hospitals must see past care siloes and engage local services to improve outcomes for homeless patients.

Health Care for the Homeless Programs

Health Care for the Homeless (HCH) programs are exceptional primary care partners. HCH programs are comprehensive primary care

sites that provide services using multidisciplinary teams. They include integrated behavioral health services, outreach, and coordinated case management.¹⁹ HCH programs are also required to provide substance abuse treatment services,²⁰ which can be a critical resource for essential hospitals with patients in need of such care.

HCH originally started as a grant-funded program but is now associated with community health centers or federally qualified health centers (FQHCs). Essential hospitals should make HCH programs a staple in their community partnerships.

Medical Respite Programs

Partnership with medical respite programs allows hospitals to discharge patients to a safe environment for recovery, which ultimately decreases their likelihood of readmission. Medical respites are operated with public and private

Social service teams can provide valuable case management and coordination for homeless patients because they can engage with a range of service providers on behalf of patients.

funding and are categorized by a number of different facility types. These include apartments or motel rooms, assisted living facilities or nursing homes, homeless shelters, substance abuse treatment facilities, transitional housing sites, and standalone facilities. In addition, some respite programs operate on a harm reduction philosophy, meaning they do not require patients to be sober. These types of respite programs fill a critical gap for those homeless patients struggling with substance abuse.²¹

Figure 2 demonstrates how accessible these two services are to essential hospitals. For more information on the programs in your area, please reference the appendix of homeless services listed by state.

Housing Solutions

The primary need for homeless patients is housing, therefore essential hospitals should seek to connect with local housing programs. There are a number of programs that focus on finding housing for homeless patients, some of which are federally funded. For example, one valuable resource from the U.S. Department of Housing and Urban Development (HUD) Homelessness Assistance Programs²² is supportive housing programs. These programs provide homeless

Mini-Case Study: Boston Medical Center and the Boston Health Care for the Homeless Program

The Boston Health Care for the Homeless Program (BHCHP) originally started in 1985 as one of the first HCH grantees. The program operates as an integrated care model, including primary care services, behavioral health care, and dental health services across a number of local clinics. In addition, BHCHP was the first HCH program to design and implement a medical respite program.

BHCHP originally started with the concept that hospitals should be initiating outreach to homeless patients and other services to build a care coalition. Boston Medical Center has been a key player in this initiative and hosts one of the program's primary care clinics. BHCHP offers another example of how hospitals, HCH, shelters, and respites can work together. BHCHP has served countless homeless patients—12,000 in 2013 alone—and stands as the model program for treating homeless patients' medical and social needs.³²⁻³³

patients with a place to stay while they increase their autonomy by developing the lifestyle, employment, and financial skills they need to transition out of homelessness permanently. Other promising solutions include Housing First programs²³ and rapid re-housing,²⁴ both of which work to get homeless patients into housing solutions quickly.

Shelters

Essential hospitals should partner with local shelters for outreach and a place to discharge homeless patients when they have no other housing options. While shelters still present health risks due to close quarters and other ill patients,²⁵ they are still a better option than sending patients back to the streets. Formal partnerships with shelters can help prevent miscommunication regarding available space and admission hours.

Other Social Services

Social service teams can provide valuable case management and coordination for homeless patients because they can engage with a range of service providers on behalf of patients. Internal hospital staff members, such as social workers, patient navigators, and community health workers can assist in this role. However, connections with external social services are also valuable. Community-based social services can assist hospitals in connecting with other programs, such as those discussed previously, as well as other important entities like police departments and jails. Social service teams are key partners for treating homeless patients.

MAKING PARTNERSHIPS SUSTAINABLE

Forming partnerships beyond the hospital system can be challenging. Most medical and social services for homeless patients remain siloed. And essential hospitals—many of which have limited resources—can have trouble connecting with these organizations. However, with the right approach, making lasting connections is possible and holds significant benefits for all parties.

First, hospitals must have a

community presence and build personal relationships with potential partners. Building trust and mutual respect with unfamiliar teams can take time.²⁷ But meeting in person and conveying an interest in partnership can foster these feelings. Essential hospitals should take the time to visit the organizations they want to partner with.

Essential hospitals can also become more involved with community meetings and discussions pertaining to the homeless population. Through

Policymakers and federal and state payers must work to realign incentives to encourage these forms of collaboration.

such in-person time, essential hospitals and partners can identify shared missions and goals and learn how each organization tackles the same issues.²⁷

Once relationships with local partners are established, it is important to meet in person on a regular basis.²⁷ Regular meetings will allow relationships to thrive and grow by keeping all players involved and on the same page. While different partners may be in different locations, regular “huddles” or meetings are critical—just as they are in team-based care within the hospital.

Likewise, it is important for partners to coordinate their efforts and data.²⁷ This is greatly facilitated by regular meetings, but may also require additional time and planning. Establishing which parties are responsible for which roles will mitigate duplicative services and better coordinate care for the patient. Sharing patient data through integrated health records can greatly aid this coordination. Integrating data systems can be challenging, time consuming, and always requires HIPAA compliance. However, such integration can lead to better outreach initiatives, better follow-up, and better outcome assessment.²⁸

Finally, essential hospitals and partners should seek to establish formal contracts, such as memorandums of understanding.²⁷ Such contracts allow for accountability regarding financial agreements as well as roles and responsibilities of different parties.

These agreements can ensure the sustainability of partnerships and allow for partners to easily evaluate progress and reassess terms if necessary.

NAVIGATING FINANCIAL BARRIERS

One of the greatest challenges hospitals will face in this endeavor is sustainable funding for partnerships and improving patient care. Although health care reform has precipitated a health care coverage expansion through Medicaid and the health insurance marketplaces (exchanges), essential hospitals and health systems will still assume a large amount of uncompensated care costs providing services to homeless patients. Further, with the exception of medical respite programs, payment incentives for hospitals, health centers, and community services to collaborate are largely nonexistent. Policymakers and federal and state payers must work to realign incentives to encourage these forms of collaboration.

Essential hospitals play a critical role in caring for homeless patients, and this role should be leveraged when addressing homelessness. But medical care alone cannot cure homelessness. Essential hospitals must partner with local entities outside the hospital. The care siloes that currently exist only perpetuate the problem. Forming partnerships can alleviate the burden of homelessness on the health care system and significantly improve the medical and social outcomes for thousands of homeless individuals and families across the country.
